

## SQL Statements

Most of the actions you need to perform on a database are done with SQL statements.

SQL statements consist of keywords that are easy to understand.

The following SQL statement returns all records from a table named "Customers":

ExampleGet your own SQL Server  
Select all records from the Customers table:

```
SELECT * FROM Customers;
```

In this tutorial we will teach you all about the different SQL statements.

## Database Tables

A database most often contains one or more tables. Each table is identified by a name (e.g. "Customers" or "Orders"), and contain records (rows) with data.

In this tutorial we will use the well-known Northwind sample database (included in MS Access and MS SQL Server).

Below is a selection from the Customers table used in the examples:

	CustomerID	CustomerName	ContactName	Address	City	PostalCode	Country
1		Alfreds Futterkiste	Maria Anders	Obere Str. 57	Berlin	12209	Germany
2		Ana Trujillo Emparedados y helados	Ana Trujillo		Avda. de la Constitución 2222	México D.F. 05021 Mexico	
3		Antonio Moreno Taquería	Antonio Moreno		Mataderos 2312	México D.F. 05023 Mexico	
4							
5		Around the Horn	Thomas Hardy	120 Hanover Sq.	London	WA1 1DP	UK
		Berglunds snabbköp	Christina Berglund	Berguvsvägen 8	Luleå	S-958 22 Sweden	

The table above contains five records (one for each customer) and seven columns (CustomerID, CustomerName, ContactName, Address, City, PostalCode, and Country).

Keep in Mind That...

SQL keywords are NOT case sensitive: select is the same as SELECT  
In this tutorial we will write all SQL keywords in upper-case.

Semicolon after SQL Statements?

Some database systems require a semicolon at the end of each SQL statement.

Semicolon is the standard way to separate each SQL statement in database systems that allow more than one SQL statement to be executed in the same call to the server.

In this tutorial, we will use semicolon at the end of each SQL statement.

Some of The Most Important SQL Commands

SELECT - extracts data from a database

UPDATE - updates data in a database

DELETE - deletes data from a database

INSERT INTO - inserts new data into a database

CREATE DATABASE - creates a new database

ALTER DATABASE - modifies a database

CREATE TABLE - creates a new table

ALTER TABLE - modifies a table

DROP TABLE - deletes a table

CREATE INDEX - creates an index (search key)

DROP INDEX - deletes an inde
